

# Connection of the Comtrend modem

## How to properly connect a Comtrend modem for VDSL and ADSL

- We connect the modem over a narrow cable with a RJ 11 connector (red or green).
- Then connect the modem to the electrical socket using the adapter from the package.
- We will not connect any hub or splitter.
- Let a modem load on.

The socket is larger than the cable connector. However, the socket is adaptive, so a cable with an connector RJ 11 must be used.

- The indicators will gradually light up.
- First, the modem will light up red, then it should turn green.
- Informations about a modem (Wi-Fi) are on the bottom label of the modem.
