# Zyxel T50 A/B VDSL/ADSL modem connection

- We use a cable with a narrow RJ 11 end to connect the modem over the cable of the former landline.
- On the modem, **the WAN (blue) socket must always remain empty** when the modem is connected in this way.
- We connect the adapter to the electrical socket and turn on the modem.

RJ 11 cable included in the package.

The connection with this type is always to the DSL port, the others remain empty.

Attention: On the Zyxel VMG 8623 – T50A, the Phone ports for connecting the phone are also grey, but they must always be empty for our types of internet. The only ports used are DSL, LAN and Power.

After connecting, the modem still does not connect to the network:

- The modem can load for longer than a few minutes, and it also downloads the necessary updates from the beginning.
- This operation takes a maximum of 2 hours.
- If even after that the modem and line are not functional, you need to contact the technical support department or use the Tobi chatbot on the www.vodafone.cz website.
- During the loading period, the Internet indicator (globe) may light up red or the modem may reset itself several times.
